## [141 7711] ISL 3.5

Consider the fitted values that result from performing linear regression without an intercept. In this setting, the ith fitted value takes the form

$$\hat{y}_i = x_i \hat{\beta},$$

where

$$\hat{\beta} = \left(\sum_{i=1}^{n} x_i y_i\right) / \left(\sum_{i'=1}^{n} x_{i'}^2\right). \tag{3.38}$$

Show that we can write

$$\hat{y}_i = \sum_{i'=1}^n a_{i'} y_{i'}.$$

What is  $a_{i'}$ ?

$$\int_{2}^{2} = \chi_{1} \frac{\partial}{\partial x_{1}} = \chi_{1} \frac{\partial}{\partial x_{2}} = \chi_{2} \frac{\partial}{\partial x_{1}} \chi_{2} = \chi_{2} \frac{\partial}{\partial x_{2}} \chi_{2} = \chi_{2} \chi_{2} = \chi_{2} \chi_{2} = \chi_{2} \chi_{2} = \chi_{2} \chi_{2} =$$

$$\alpha_{i} = \frac{\chi_{i} \chi_{i}}{\chi_{i} \chi_{i}^{2}}$$

## [241 7711] ESL 3.4

Ex. 3.4 Show how the vector of least squares coefficients can be obtained from a single pass of the Gram–Schmidt procedure (Algorithm 3.1). Represent your solution in terms of the QR decomposition of X.

$$\begin{array}{l}
X = QR \\
\hat{\beta} = (x^T x)^{-1} x^T y \\
= ((QR)^T QR)^{-1} (QR)^T y \\
= (R^T X^T QR)^{-1} R^T Q^T y \\
